

1. AI College Information Assistant

Requirement: Create a simple AI assistant that answers questions about a college using fixed information provided in the program.

What to do: Store college details like principal name, HOD names, department names, library timing, office timing, and contact details in a static text variable. Take a question from the user and inject this college information into the prompt. The AI should answer only using the given college data. Students should test questions like “Who is the CSE HOD?” and “What is the library timing?”

2. AI Student Result Analyzer

Requirement: Create an AI tool that analyzes student marks using fixed student result data.

What to do: Store student names, subjects, marks, and grades in a static text variable. Take a question from the user and pass both the result data and question to the AI model. The AI should answer questions such as highest marks, lowest marks, average performance, and ranking of students. Students should design the prompt carefully so the AI does not use outside information and gives answers only from the provided result data.

3. AI Library Assistant

Requirement: Create an AI assistant that helps students find books from a fixed library database.

What to do: Store book details such as book title, author name, subject, availability status, and shelf number in a static text variable. Take a user question and inject the library data into the prompt. The AI should answer questions like “Which Python books are available?” or “Where is the Machine Learning book kept?” Students should ensure that the AI responds only from the given library context and says “Not available” if the book is not present.

4. AI Hostel Information Assistant

Requirement: Create an AI assistant that answers hostel-related questions using fixed hostel information.

What to do: Store hostel details such as room availability, mess timings, hostel rules, warden name, visitor timing, and emergency contact number in a static text variable. Take a question from the user and inject the hostel information into the prompt. The AI should answer only from the provided hostel data. Students can test questions like “Which rooms are vacant?”, “What is the dinner timing?”, and “Who is the hostel warden?”

5. AI Restaurant Menu Assistant

Requirement: Create an AI assistant that answers questions about a restaurant menu using fixed menu data.

What to do: Store menu items, prices, food categories, vegetarian/non-vegetarian status, and availability in a static text variable. Take a customer question and inject the menu data into the AI prompt. The AI should answer questions like “What is the cheapest item?”, “Suggest a vegetarian dish,” or “What is available under ₹200?” Students should design the prompt so the AI recommends items only from the given menu and does not invent dishes.
